Moving towards a more product-innovating direction, further expanding and diversifying eco-friendly product range

Seow Khim Polythelene Co (SKP), Singapore's largest and leading supplier of disposable food packaging, has announced its intentional step to meet and serve the growing B2B and B2C need for food packaging through the manufacturing of its eco-friendly food packaging range.

As part of their sustainable food packaging endeavour, SKP has not only converted their facilities to using solar energy, but has also begun manufacturing their in-house biodegradable food packaging and cutlery range called EcoVue. Using the latest green technology, BioTransformation, EcoVue contains biodegradable plastic cutlery, biodegradable plastic plates, biodegradable disposable cups, and biodegradable containers that are made with 100% biodegradable plastic.

EcoVue plastic decomposes completely at a much faster rate than traditional plastic without leaving any plastic waste behind, breaking it down into organic matter, such as natural gases, biomass, and water, which are then absorbed back into the environment. SKP will also be making changes to their visual merchandising at their respective retail outlets, which includes building an eco-wall or area that will showcase every sustainable product. Additionally, they have announced plans to train their retail staff, updating them with eco-friendly-related resources and knowledge.
