Alpha Grill is designed to empower restaurant staff to focus on crafting high-quality burgers and enhance the dining experience by automating numerous repetitive tasks, including grill cleaning and cook time management

Aniai, a rapidly growing robotics company and a global leader in innovative kitchen solutions has unveiled its strategic plans for North America, marking a significant milestone in the company's global growth strategy. As a key component of this strategy, the South Korean company has recently established its headquarters in New York City, added a pivotal member to its leadership team, and is gearing up to hire top talent to support its North American expansion.

Aniai's flagship product Alpha Grill leverages advanced artificial intelligence (AI) and robotics to automate the hamburger patty cooking process, enhancing efficiency and consistency in restaurant kitchens. Aniai is currently conducting pilot tests in collaboration with several significant North American enterprise hamburger brands and anticipates implementation at multiple locations over the next six to twelve months.

Alpha Grill is designed to empower restaurant staff to focus on crafting high-quality burgers and enhance the dining experience by automating numerous repetitive tasks, including grill cleaning and cook time management. This automated grill features a rapid cooking system with a double-sided grill, simultaneously preparing up to eight hamburger patties at a time or 200 patties per hour, and it includes a self-cleaning function. An advanced monitoring system powered by AI, equipped with cameras and sensors, provides real-time tracking of patty temperatures and quality.
