Bioriginal has developed a sustainable line of omega-3 fish, algal, and plant-based oils with technology from POS Biosciences

Saskatoon, Canada – Bioriginal Food & Science Corp., a wholly owned subsidiary of Cooke Inc. has developed a sustainable line of omega-3 fish, algal, and plant-based oils with technology from POS Biosciences.

Leveraging Cooke's marine resources as a global aquaculture fish farmer, Bioriginal has access to a secure source of sustainable fish oil. Combining these new fish oil products, with an environmentally friendly source of highly concentrated algal DHA, and exclusive access to Bioriginal's network of family-owned farms, Bioriginal and POS are poised to offer a sustainable supply of omega-3 oils across the pet and human nutrition markets.

With an industry focused on preserving fish populations around the globe, expanding the market's access to sustainable, environmentally friendly sources of fish and vegan omega-3 oils is a natural fit for Bioriginal. The resulting line of omega-3 oils are fully traceable, based on sustainably managed fish sources secured in aquaculture facilities, algae harvested only once in nature, then repurposed into a renewable production process as a self-replicating source, and flax oils managed through responsible farming practices in the pristine Canadian prairies.

The launch of this sustainable omega-3 line allows Bioriginal to offer a reliable, renewable source of omega-3s, tracking the entire product from farm to shelf. Integrating these new oils with POS Biosciences' ability to concentrate, refine, deodorize, and blend oils, with customized flavour and odour properties, inspires new possibilities for omega-3-rich oil products.
