The initiative aims to modernise food production and storage practices by integrating advanced technologies and sustainable methods

GUYIMEX International Inc., a well-respected company in Guyana's food production industry, has announced the launch of an innovative food production and storage facility. This facility is designed to provide significant support to the country's agricultural sector.

The initiative aims to modernise food production and storage practices by integrating advanced technologies and sustainable methods. Central to the facility is the incorporation of cutting-edge hydroponic systems, which allow for plant cultivation without soil, using mineral nutrient solutions in water. This method optimises water and nutrient use, promotes faster growth rates, and yields higher produce compared to traditional farming methods.

Moreover, the facility features temperature-controlled environments that ensure optimal storage conditions for various food products. This state-of-the-art infrastructure is crucial for preserving food quality and safety throughout the supply chain, reducing waste and extending the shelf life of perishable items. These advanced storage solutions will enable GUYIMEX to provide fresh and safe products to consumers, ultimately supporting food security and upholding quality standards in the region.
