Pipeline Organics's technology uses advanced chemistry and manufacturing processes to convert sugar-rich wastewater into a continuous supply of renewable electricity

Pipeline Organics's technology uses advanced chemistry and manufacturing processes to convert sugar-rich wastewater into a continuous supply of renewable electricity

Coca-Cola Europacific Partners (CCEP) has announced an investment in Pipeline Organics, a climate tech startup hoping to revolutionise the generation of clean and renewable energy.

Pipeline Organics's technology uses advanced chemistry and manufacturing processes to convert sugar-rich wastewater into a continuous supply of renewable electricity.

This breakthrough technology has the potential to power essential processes across CCEP's sites, from lighting to powering production lines.

CCEP aims to scale this innovative technology by providing Pipeline Organics with access to its sites where the technology can be trialled, using the sugar-rich wastewater that is created as a by-product of drinks manufacturing.

CCEP has been steadily progressing towards its renewable electricity goals, with renewable electricity already used in 78% of its operations in 2023. By investing in breakthrough solutions like Pipeline Organics, CCEP aims to accelerate the adoption of clean energy technologies and drive positive change in the industry.
