Kemin Industries, a global ingredient manufacturer that strives to sustainably transform the quality of life every day for 80 per cent of the world with its products and services, is debuting the EDIE Generation 2. This applicator is designed to deliver precision, connectivity, and automation in chlorine dioxide disinfection for livestock and poultry operations, and will be introduced at PEAK, the Midwest Poultry Federation's annual convention, April 14-16, in Minneapolis.

The next evolution in fully integrated water-management systems, EDIE Generation 2, represents a significant advancement in water disinfection application technology, combining intelligent automation, real-time monitoring, and enhanced system connectivity into a single, integrated platform. Engineered for ease of use and reliability, the system provides operators with complete control over water disinfection processes while reducing the need for manual intervention.

"Water quality plays a critical role in animal health and operational productivity," said Dillon Mellick, Business Manager, Kemin Animal Nutrition and Health – North America. "With EDIE Generation 2, we are delivering connected intelligence that helps producers manage water disinfection more precisely, more efficiently, and with greater confidence."

EDIE Generation 2 is designed to monitor and manage critical water quality parameters directly within the water line. The system tracks available chlorine dioxide levels and offers optional measurements of pH and oxidation-reduction potential (ORP), giving producers real-time actionable insight into system performance and water quality.
